1. Introduction

1.1 Purpose of this Document

This SRS document outlines the purpose and goals of TranspoLink, a platform connecting truck owners and business owners for easy goods transportation. It describes who will use the system, what it aims to do, and how it will look and behave. It ensures that our development team, clients, and users all share the same understanding of the product's purpose and functionality.

1.2 Scope of the Development Project

The **TranspoLink** system is designed to help **truck owners** and **business owners** manage and track goods transportation easily through a digital platform. Whenever a user logs in, their actions such as posting goods, posting available trucks, or accepting transport requests are recorded in the system. The platform automatically tracks the activity and time of interaction to ensure smooth coordination between users.

The system will allow authorized users to manage their profiles and postings:

1. **Manage Access Privileges:** Only authorized users, such as administrators, can update or modify a user's access rights — for example, deciding whether a user can post goods or trucks. This helps maintain the system's security and ensures that only verified users can perform important actions.
2. **Monitor and Verify Activity:** The system can identify whether a user's access has been restricted or blocked due to policy violations such as misuse, fake postings, or cancellation abuse. These results will only be visible to the admin or authorized monitoring staff.

Initially, we plan to implement this system for a limited group of users — around **60 people** (including both truck drivers and business owners) — as part of the **Pilot Phase**. Once the pilot is successful, TranspoLink can be expanded to more users and regions, eventually connecting a larger network of transporters and businesses.

The scope of TranspoLink goes beyond a single platform or region. The same system can later be applied to **logistics networks in other cities or industrial areas**, helping streamline the process of booking trucks and transporting goods. The platform could even be adapted for use in other industries, such as warehouse management, delivery tracking, or supply chain monitoring — providing a complete smart logistics solution.

1.3 Definitions, abbreviations and acronyms

Definitions

Table 1 gives explanation of the most commonly used terms in this SRS document.

Table 1: Definitions for most commonly used terms

Term	Definition
TranspoLink	A digital platform that connects truck drivers and business owners to simplify goods transportation and truck booking.
User Role	The type of account assigned to a user — such as Truck Driver, Business Owner, or Admin — which decides what actions they can perform.
Goods Posting	The feature that allows business owners to list their goods that need to be transported.
Truck Posting	The feature that allows truck drivers to list their trucks as available for transport jobs.
Transport Request	A request sent by a business owner to a truck driver to transport goods.
Booking Confirmation	The process when both the truck driver and business owner agree on a transport deal.
Delivery Status	The progress of a transport job, showing stages like pending, in transit, or delivered.
Admin Dashboard	The control panel used by the admin to manage users, monitor bookings, and handle reported issues.
Policy Violation	Any misuse or activity against platform rules, such as fake postings or repeated cancellations.
Cluster Management	A module that groups related trucks and goods to make large-scale transport coordination easier.

Abbreviations

Table 2 gives the full form of most commonly used mnemonics in this SRS document.

Table 2: Full form for most commonly used mnemonics

<i>Acronym</i>	<i>Full Form / Meaning</i>
SRS	Software Requirements Specification
UI	User Interface
UX	User Experience
DB	Database
API	Application Programming Interface
JWT	JSON Web Token
HTTP	Hypertext Transfer Protocol
JSON	JavaScript Object Notation
REST	Representational State Transfer
OTP	One-Time Password

1.5 Overview

The remaining sections of this document give a complete description of the TranspoLink system, including details about its users, hardware and software setup, and the system's functional and data requirements.

Section 2 provides a general description of the project, outlining how TranspoLink works, the main features, and how different users—truck owners and business owners—interact with the system. It also covers assumptions and constraints considered during the design.

Section 3 focuses on the specific requirements of the product. It describes the functional modules, the external interfaces, and provides a detailed explanation of how each feature operates within the platform.

2. Overall Description

2.1 Product Perspective

TranspoLink is a web-based platform that connects truck drivers and business owners to make goods transportation faster and easier. Drivers can post available trucks, while business owners can post goods that need to be moved.

The system works on any device with an internet connection—no special hardware is needed. All data, including user details, bookings, and delivery status, is securely stored in a cloud database.

In the future, TranspoLink can integrate with smart tools like GPS or RFID for better tracking and security. It's built to be simple, reliable, and expandable, with potential for features like digital payments, route planning, and warehouse management.

Figure 1: Block Diagram of the TranspoLink System showing connection between Business Owners, Truck Drivers, and the Main Platform.

2.2 Product Functions

- The system checks each user's login details (email and password) to verify their identity.
- Users can browse available trucks or goods, with the information shown in real time from the database.
- Every booking between a truck driver and a business owner is saved, including details like IDs, time, and delivery status.
- Admins can update or remove user accounts, goods listings, or truck posts whenever needed.
- The system can detect users who break the rules, such as posting false details or canceling repeatedly, and only admins can see these violations.
- It keeps a clear record of times for activities like posting, booking, and confirming deliveries to ensure transparency for all users.

2.3 User Characteristics

User	Characteristics	Key Actions
Driver	- Owns or operates a vehicle. - Provides vehicle details (Truck). - Accesses the platform via web or mobile.	Post Truck ,View Good, Accept Request
Business Owner	- Posts goods for transport (Load). - Manages payments and shipment tracking. - Accesses the platform via web or mobile.	Post Goods ,View Trucks ,Send Requests
Admin	- Manages platform content and users. - Reviews and removes inappropriate content. - Monitors system activity to maintain security and compliance.	ManageUser,Remove Content

2.4 General Constraints, Assumptions and Dependencies:

Constraints

- TranspoLink works only with a stable internet connection.
- The system should be fast, lightweight, and run smoothly on both computers and mobile devices.
- Page loading or processing time (like login or booking) should not exceed five seconds.
- Regular database backups must be done to prevent data loss.

Assumptions

- All users (drivers, business owners, and admins) have basic knowledge of using web platforms.
- The system will be accessed through common devices such as laptops and smartphones.
- Users will have a stable internet connection while using the platform.

Dependencies

- The system depends on cloud storage for real-time data updates.
- Its performance relies on network quality and server uptime.
- Future features like GPS tracking or digital payments will depend on third-party APIs.

2.5 Apportioning of requirements

The development and implementation of the TranspoLink system will be carried out in three main phases:

i. Pilot Phase:

In the first stage, the basic version of TranspoLink will be tested with a small group of truck drivers and business owners. The goal is to check the main functions like user login, posting goods or trucks, and booking transport. Feedback from users in this phase will help improve the system before a full launch.

ii. Full Deployment:

After the pilot phase runs successfully, the system will be deployed across a larger user base. More features will be added, such as real-time booking updates, admin monitoring, and secure data management. This phase will also focus on improving system speed, reliability, and user experience.

iii. Future Expansion:

In the final phase, TranspoLink will be expanded with advanced features like GPS tracking, digital payments, and route optimization. The aim is to make it a complete logistics management platform that connects all parts of the transport process through one unified system.

Each phase will include the same core functions; the main difference will be in the number of users, the scale of operations, and the added features.

3. Specific Requirements

3.1 External Interface Requirements

- The system requires minimal graphics and will have a clean, simple web interface for user interaction.
- No sound or animation features are needed; the focus is on smooth performance and quick loading.
- The platform should work well on any standard web browser with a screen resolution of at least 1024×768 pixels, ensuring compatibility with both computers and mobile devices.
- Voice or notification features are not essential but can be added in future versions — for example, to alert users about booking updates or delivery confirmations.

3.2 Detailed Description of Functional Requirements

Table 3 shows the template used to describe the functional requirements for different types of TranspoLink users — *Guest Users*, *Driver Users*, and *Business Owner Users*. This template helps define what each screen or feature should do, what inputs it takes, how it processes them, and what outputs are generated.

Table 3: Template for Describing Functional Requirements

Aspect	Description
Purpose	Explains the goal of the feature and why it exists.
Inputs	Defines the data or actions provided by the user and how they are entered into the system.
Processing	Describes how the system processes the input and what internal actions or checks are performed.
Outputs	Specifies the results shown to the user after processing, including messages, data displays, or actions taken.

3.2.1 Functional Requirements for Guest User Dashboard

Table 4: Functional Requirements for Guest User Dashboard

Aspect	Description
Purpose	Allows visitors to access limited features like searching routes or viewing available trucks and goods without logging in. Encourages them to register for full access.
Inputs	Guest users can enter search keywords such as pickup and delivery locations, or select language preference (English/Hindi).
Processing	The system processes the input query and fetches relevant data from the database. Only high-level route and availability data are displayed; no personal or detailed information is revealed.
Outputs	A list of available trucks or goods matching the search. A “Login” or “Register” prompt is displayed for detailed access.

3.2.2

Functional Requirements for Driver Dashboard

Table 5: Functional Requirements for Driver Dashboard

Aspect	Description
Purpose	Provides drivers with tools to manage their profile, truck details, postings, and delivery status.
Inputs	Driver inputs include profile information (name, contact), vehicle details (number, capacity, type), and delivery updates.
Processing	The system validates the inputs, updates driver details in the database, and links vehicle and booking data to the driver’s account. Real-time tracking and dashboard analytics are generated.
Outputs	A personalized dashboard showing total earnings, active bookings, and delivery updates. Confirmation messages appear after each update.

3.2.3 Functional Requirements for Business Owner Dashboard

Table 6: Functional Requirements for Business Owner Dashboard

Aspect	Description
Purpose	Allows business owners to post loads, view matching trucks, and track deliveries in real time.
Inputs	Load details such as pickup address, delivery location, load type, and size are entered by the business owner. Feedback or ratings may also be submitted.
Processing	The system checks for available trucks matching the entered criteria, updates the booking database, and tracks delivery progress.
Outputs	Displays matching trucks, booking confirmation messages, and live shipment tracking. After delivery, a feedback form is generated for the business owner.

3.2.4 UML Diagrams

To better illustrate the system's functionality, the following UML diagrams are included:

(a) Use Case Diagram

Figure a: Use Case Diagram for TranspoLink System

(b) Activity Diagram

Figure b: Activity Diagram for TranspoLink System

Depicts the step-by-step process of how a booking is created and completed — from user login to delivery confirmation.

(c) Swimlane Diagram

Figure c: Swimlane Diagram for TranspoLink System

(d) Data Flow Diagram

The Data Flow Diagram (DFD) illustrates how information moves between different components of the TranspoLink system.

It represents the logical flow of data — showing how inputs (like user login details or booking requests) are processed and how outputs (like search results or delivery confirmations) are generated.

DFD Level 0(Context Level):

LEVEL 0 DFD (CONTEXT DIAGRAM)

Figure d.1:DFD LEVEL 0

DFD Level 1:

Figure d.2:DFD LEVEL 1

DFD LEVEL 2:

Level 2 DFD

Figure d.3:DFD LEVEL 2(Booking Management Process)

This Level 2 DFD elaborates the internal flow of the Booking Management process in TranspoLink. It shows how bookings are created, validated, updated, viewed, and canceled between Truck Drivers and Businessmen using the BookingDB.

(e) Interaction Diagrams

a. Sequence Diagram

1. User Login Sequence Flow for TranspoLink System

The following sequence diagram illustrates the interaction between the User, Login Interface, and TranspoLink Authentication Service during the login process. The user provides credentials, which are forwarded to the authentication module for validation. Based on the result, the system either grants access and redirects the user to the dashboard or displays an error message.

Figure e.1 : User Login Sequence Flow for TranspoLink System

2. UML Sequence Diagram for the Truck Booking Process

This sequence diagram illustrates the interaction between the **Business Owner**, **TranspoLink System**, **Matching Engine**, **Booking Database**, **Driver**, and **Notification Service** during a booking request. The system finds available trucks, creates a booking, and notifies the driver. Based on the driver's decision (accept/reject), the booking status is updated, and the business owner is notified accordingly.

Figure e.2: UML Sequence Diagram for the Truck Booking Process

3. Collaboration Diagram for Truck Booking Process

The **collaboration diagram** shows how key entities interact in the TranspoLink truck booking process. The Business Owner creates a booking through the TranspoLink System, which communicates with the Matching Engine and Database to find available trucks. After confirmation, the system saves the booking, notifies the Driver, updates the status based on the driver's response, and informs the owner of the final outcome.

Figure e.3: Collaboration Diagram for Truck Booking Process

f. State Chart Diagram

Figure f.1: State Chart Diagram for TranspoLink System

g. Deployment Diagram:

Figure g.1: Deployment Diagram for TranspoLink System

3.3 Performance Requirements

- The TranspoLink system is a web-based platform and runs on any device with an internet connection and a modern web browser. *No special hardware is required.*
- The software supports multiple users accessing the system simultaneously, such as drivers, business owners, and administrators.
- The system primarily handles text-based and form data, including user details, goods descriptions, and booking information.
- Under normal network conditions, at least *95% of user requests (such as login, posting, or booking) should be processed within five seconds.*

3.4 Logical Database Requirements

This diagram represents the logical structure of the TranspoLink system, showing key classes such as User, Driver, BusinessOwner, Truck, Load, Booking, and Feedback, along with their relationships and key attributes.

Figure 2:Class Diagram for Transpolink System

3.5 Quality Attributes

The product is designed for a wide range of users such as truck drivers, business owners, and guest users. The system must load quickly and perform smoothly across different devices like desktops, tablets, and mobile phones.

It should handle various user inputs effectively, including incorrect entries or unexpected actions, without crashing or losing data.

The system must also ensure secure access, reliable performance, and user-friendly navigation to provide a smooth overall experience.

3.6 Other Requirements

None at this time

4. User Story Cards:

a. User Story Card 1 — User Registration / Login

Front Of the Card

#0001	USER REGISTRATION & LOGIN	Fibonacci Size: #3
-------	---------------------------	--------------------

As a user, I want to create an account or log in, so I can access TranspoLink and manage my transport activities.

Sign in to your account

Welcome back to TranspoLink

Email Address

Password

☐ Remember me

[Forgot your password?](#)

Sign in

Don't have an account? [Sign up](#)

Back Of the Card

Confirmation:

1. Success – valid user logged in and redirected to dashboard.
 - a. “Remember Me” checked – store session.
 - b. “Remember Me” unchecked – require login next time.
2. Failure – display message:
 - a. “Invalid email format.”
 - b. “Incorrect password.”
 - c. “User not found.”
 - d. “Service unavailable, please try again.”

b. User Story Card 2 — Post Truck (Driver)

Front Of the Card

#0002

POST GOODS

Fibonacci Size: #5

As a businessman, I want to post my goods for transport, so I can find available trucks and send transport requests.

The mockup shows a form titled "Post Your Goods" with the instruction "Fill out the form below to post your goods and connect with verified drivers." The form is divided into four sections: "Goods Information", "Location & Timing", "Requirements & Budget", and "Contact Details". The "Goods Information" section contains a "Request Title *" field with a placeholder "e.g., Transport 500kg Electronics from Delhi to Mumbai" and a "Description *" field with a placeholder "Describe your goods in detail...".

Back Of the Card

Confirmation:

1. Success – goods details saved and listed for available drivers.
 - a. Display message “Goods posted successfully.”
2. Failure – display message:
 - a. “Please fill all required fields.”
 - b. “Invalid weight or location.”
 - c. “Database error, please retry.”

c. User Story Card 3 — Post Goods (Business Owner)

Front Of the Card

#0003	POST TRUCK	Fibonacci Size: #4
-------	------------	--------------------

As a truck driver, I want to post my truck details and availability, so I can receive goods requests from businesses.

Post Truck

List your available truck and connect with businesses looking for transport services.

 **Truck Information**

Truck Title *

Truck Type *

 **Tips for Truck Owners**

- Provide accurate truck capacity and dimensions
- Keep your contact number active and reachable
- Update availability dates regularly

Back Of the Card

Confirmation:

1. Success – truck details saved and made visible to users.
 - a. Display “Truck posted successfully.”
2. Failure – display message:
 - a. “Invalid truck number.”
 - b. “Missing required fields.”
 - c. “Unable to connect to database.”

d. User Story Card 4 — Send Transport Request

Front Of the Card

#0004 SEND TRANSPORT REQUEST Fibonacci Size: #5

As a businessman, I want to send a transport request to a driver, so I can book transport for my goods.

Back Of the Card

Confirmation:

1. Success — request sent successfully.
 - a. Display message “Request sent to driver.”
2. Failure — display message:
 - a. “Truck no longer available.”
 - b. “Connection error.”
 - c. “Unable to send request, try again later.”

e. User Story Card 5 — Booking Confirmation & Delivery Status

Front Of the Card

#0005

BOOKING & DELIVERY CONFIRMATION

Fibonacci Size: #5

As a driver and businessman, I want to confirm booking and delivery, so I can update the transport status and ensure completion tracking.

The mockup shows a 'Truck Booking' screen with a truck icon and a 'Pending' status. It displays details for a 'mini truck - HP19A1234' from Shimla, Himachal Pradesh. The pickup date is 10/31/2025 and the agreed price is ₹200,000. Contact information for Vansh Rattan is provided, including a phone number and email. At the bottom, there are 'Accept' and 'Reject' buttons, and a timestamp 'Requested on 10/31/2025, 5:44:18 PM'.

Truck Booking Pending
Request from Vansh Rattan

mini truck - HP19A1234
Shimla, Himachal Pradesh

Pickup Date **Agreed Price**
10/31/2025 ₹200,000

Contact Information
Vansh Rattan
9418141428
vanshrattan5@gmail.com

Accept **Reject**

Requested on 10/31/2025, 5:44:18 PM

Back Of the Card

Confirmation:

1. Success – booking confirmed and delivery recorded.
 - a. Display “Delivery completed successfully.”
 - b. Update system logs.
2. Failure – display message:
 - a. “Booking not found.”
 - b. “Unable to update status.”
 - c. “Server error, please try again.”

5: TESTING:

The testing phase is critical to verify that the TranspoLink Bharat web application aligns with the specified requirements and is reliable, secure, and production-ready for real-world user deployment. Our testing strategy includes Module-Level Unit Testing, End-to-End System Testing of the browser user journey, and Validation Testing for the logistics posting and matching workflow.

1.1 Test Plan

1. Objectives

The main objectives of this testing plan are:

- To verify that all functional requirements (e.g., truck search, goods posting, truck posting, matching system, user authentication, contact query) of TranspoLink Bharat are correctly implemented.
- To validate the accuracy of the location-based truck availability search using real city inputs and date selection.
- To ensure that the driver/truck matching engine processes bookings/search results and triggers user-visible notifications or outputs correctly.
- To confirm that Post Goods and Post Truck submission forms accept inputs and store logistics data accurately.
- To ensure the system meets required performance benchmarks (average response time < 5 seconds for search and form submission responses).
- To verify that all booking data, posted truck/goods details, and uploaded attachments (if supported) are handled securely and not exposed on the public network.

2. Scope of Testing

Testing will be conducted across the following major areas:

- Unit Testing:
 - o Backend modules such as truck search processing, goods input validation, truck input validation, matching logic, and database query operations.
 - o Frontend UI components including city input fields, date selector, dropdown validation, form submission buttons, and page navigation links.
- Validation & Functional Testing:
 - o Input testing for supported fields (city names, date format, subject selection, form text limits).
 - o Ensuring correct handling of empty or incorrect inputs with proper UI error messages.

- **System & End-to-End Testing:**
 - o Complete user journey: open website → login/register → search trucks → view results → post goods/truck → receive UI confirmation → trigger matching/notification flow (if applicable).
 - o Navigation routing from frontend → backend → database → response UI.

3. Testing Environment

- **Client Environment:**
 - o Browsers: Google Chrome (v120+), Microsoft Edge (v115+), Mozilla Firefox (v115+).
 - o Devices: Desktop, Laptop, Android Mobile Browser support.
- **Server Environment:**
 - o Web backend frameworks such as Node.js/Express, Flask, or Spring Boot services deployed on a web hosting server.
 - o Production deployment platforms (e.g., Render, Vercel, AWS, or any cloud VM used for your hosted web system).
- **Database:**
 - o SQL/NoSQL database storing truck posts, goods posts, contact inquiries, and booking/search logs.
 - o Database must only be accessible internally to backend servers (not public-facing).
- **Matching & Notification Engine (if deployed separately):**
 - o Background service that listens for new truck or goods posts/searches and processes matches.
 - o Web UI notification panel or email/SMS alert service (depending on your implementation).

4. Risk Management in Testing

Testing will specifically evaluate system responses to high-risk situations, including:

1. External Unavailability:

Simulated network/API/server downtime to ensure the website shows fallback/error messages and remains stable.

2. Poor-Quality or Invalid Inputs:

Testing how the system behaves when users enter unsupported city names, incorrect date formats, or invalid text input.

3. Unclear or Incorrect User Actions:

Ensuring the website handles invalid form submissions and navigation failures gracefully without crash.

4. Performance Bottlenecks:

Monitoring delays during search processing or form submission, ensuring responses remain within acceptable time limits.

5. Data Security & Privacy Risks:

Verifying that posted logistics details, user data, and uploaded files (if any) are securely transmitted and not publicly exposed or leaked through browser/network calls.

5.2 TESTCASES:

TEST CASE 1: Verify Home Page Loads and Displays Truck Search Section

Test description:

The objective is to confirm that users can access the TranspoLink Bharat website home page and view the main truck search module. This verifies that the system loads UI components correctly in a browser environment.

Expected Results :

Upon opening the home page, the website must load successfully and display all main UI elements without errors. The truck search section must be visible and interactable.

Actual Results :

The TranspoLink Bharat home page loaded successfully in the web browser without errors. All UI elements including the website logo, title "TranspoLink", tagline, navigation menu, and the truck search section were displayed correctly. The input fields (Pickup Location, Drop Location, Loading Date) and the "Find Trucks" button were visible and interactable, confirming that the home page UI loaded as expected.

Test Execution Screenshot:

TEST CASE 2 : Verify Truck Search Form Accepts Inputs

Test description:

The objective is to confirm that the truck search form on home page accepts pickup city, delivery city and loading date inputs correctly.

Expected Results :

User input must be accepted and the website must process the search request without error. The system must not crash or reject valid text/date format.

Actual Results :

Upon entering valid city names in the Pickup Location and Drop Location fields and selecting a loading date using the calendar picker/manual entry (dd-mm-yyyy), the TranspoLink Bharat truck search form accepted all inputs successfully. The "Find Trucks" button was clicked and the website processed the search request without errors or input validation failures. No page crash occurred, and the system did not reject any correctly formatted text or date values, confirming that the input fields are working as expected in the browser-based deployment.

Test Execution Screenshot:

TEST CASE 3 : Verify Post Truck Page Loads Submission Form

Test description:

The objective is to confirm that Business/Driver users can access Post Truck page and view the truck posting submission form.

Expected Results :

The Post Truck page must open successfully and show input fields for truck data entry without UI errors.

Actual Results :

Upon opening the TranspoLink Bharat website in a web browser and clicking the "Post Truck" menu item from the header, the Post Truck page loaded successfully without errors. The truck posting submission form was displayed correctly with all required input fields for entering truck details. The UI rendered smoothly, and no page crash or layout issues occurred, confirming that Business/Driver users can access and interact with the truck posting form as expected in the browser-based deployment.

Test Execution Screenshot:

Post Truck Details

Tips for Truck Owners

- Provide accurate truck capacity and dimensions
- Keep your contact number active and reachable
- Update availability dates regularly
- Mention any special features (GPS, insurance coverage)
- Respond quickly to business inquiries

Your truck has been posted successfully! Businesses will contact you soon.

TEST CASE 4 : Verify Post Goods Page Loads Submission Form

Test description:

The objective is to confirm that users can navigate to Post Goods page and view the goods posting form for transport.

Expected Results :

Post Goods page must open and show goods submission input module correctly.

Actual Results :

Upon opening the TranspoLink Bharat website in a web browser and clicking the "Post Goods" menu option from the header, the Post Goods page loaded successfully without any errors. The goods submission form was displayed properly with all required input fields for entering goods details for transport. The UI remained stable, smooth, and responsive, and no page crash or rendering issues occurred, confirming that users can successfully access and interact with the Post Goods form as expected in the browser-based deployment environment.

Test Execution Screenshot:

TEST CASE 5 : Verify "Send Message" Button Sends Email to Entered Recipient

Test description:

The objective is to confirm that when the user submits the contact form on the TranspoLink Bharat website and clicks the "Send Message" button, the message is delivered via email to the address entered in the Email Address field, validating form submission and email delivery functionality.

Expected Results :

Upon clicking the "Send Message" button, the system must successfully send the message to the provided email address. A submission success confirmation or UI indication should appear, and the email must be received in the inbox without failure.

Actual Results :

Upon clicking the "Send Message" button, the contact form submitted successfully and the system triggered the email delivery process. The message was received in the inbox of the entered email address, confirming that the contact email functionality is working as expected.

Test Execution Screenshot:

TEST CASE 6 : Verify Post Goods Page Loads Submission Form

Test description:

The objective is to confirm that registered users can sign in to the TranspoLink web platform using correct login credentials through a web browser.

Expected Results :

System must authenticate the user successfully, start a login session, and redirect the user to Home/Dashboard without error.

Actual Results :

Upon entering valid registered credentials and clicking the Sign-In button, the system authenticated the user successfully and redirected to the Home page without any failures. A user session was established, confirming that Sign-In functionality is operating correctly in the browser-based deployment.

Test Execution Screenshot:**5.3 Test Reports by Peers**

Peer testing was conducted by a group of academic users to ensure the TranspoLink Bharat web platform is technically stable, easy to navigate, and accessible to general end-users through standard web browsers. The purpose was to validate that the logistics search module, posting forms, authentication, and UI interaction flow operate reliably in a real deployment environment. The following table summarizes the qualitative feedback and observations received:

Tester Name	Profile	Feedback
-------------	---------	----------

Dixant	B.Tech (CSE), 3rd Year	<i>I tested the website as a Business User. Things that dixant liked were that the pages opened quickly, the forms for posting or searching didn't lag and he was impressed by the easy navigation</i>
Kashish	B.Tech (CSE), 3rd Year	<i>Kashish checked the full flow of the web platform as a Business User. Multiple route searches loaded instantly and the UI stayed stable even when switching screens very fast.</i>
Yash	B.Tech (CSE), 3rd Year	<i>Yash verified on the business window that every menu option opens the right section. The design looks clean and structured on my browser. Everything behaves like a polished web platform should.</i>
Harshit	B.Tech (CSE), 3rd Year	<i>Harshit tested frequent input changes as a Business User. He typed fast, changed dates repeatedly, clicked buttons continuously — the website never froze or broke. He found UI to be quite responsive</i>
Gurnoor	B.Tech (CSE), 3rd Year	<i>Gurnoor tested language toggle and contact form as a Business User. The interface stays easy, readable on a normal Chrome browser. The system never shows random errors.</i>
Hemant	B.Tech (CSE), 3rd Year	<i>Heymant tested the website from a Truck User perspective. The goods availability search responded instantly, and scrolling the results was smooth. Filters and city inputs worked correctly every time.</i>
Rishi	B.Tech (COE), 3rd Year	<i>Rishi verified form submissions and searches as a Truck User. Even when submitting empty fields first and then correcting them, the platform handled it properly without crashing.</i>
Shivansh	B.Tech (CSE), 3rd Year	<i>Shivansh as a Truck User checked the search -> view-> back navigation many times. The website loads fast and remains stable even under rapid clicks and continuous testing.</i>
Tanish	B.Sc (Finance), 2 nd year	<i>Tanish has a background in finance he quite liked the way our model worked and was curious to know how we thought of generating our profits for our service he also compared our app to bla bla for trucks and goods</i>
Puranjay	B.Tech (CSE), 3rd Year	<i>Puranjay tested the complete Truck User journey (Home -> Truck Search -> Available Trucks -> Contact). No UI delays, no freeze, everything felt well optimized for real browser deployment.</i>
